

# Don't just **reprocess** your microseismic data **REVITALIZE YOUR DATA**

*Conventional*

*Independently determined source mechanisms*

You have already spent money on surface microseismic datasets, but...

- You don't have independent source mechanisms for each event
- You cannot distinguish between wet and dry events with confidence
- Your microseismic event locations are not accurate enough to characterize stages
- You are struggling to interpret incoherent clouds of events

Are the results truly useful for planning for the next drilling program?

**PREPARE TO DRILL WITH CONFIDENCE**

## **NANOSEIS**
